

Mapping of research sites conducting clinical trials of experimental drugs involving the human body

In these research facilities involving the human body (LRIPH), tomorrow's treatments are tested and studied: new drugs, innovative biotherapies (cellular and genetic), future medical devices, and even cosmetics or nutritional products. In certain cases provided for under French regulations, research sites must be authorized by the Regional Health Agency (ARS).

Where are the authorized LRIPHs in the Paris region? What are their research themes ?

- Are you in good health and would like to help research by volunteering to take part in a trial on a drug? A medical device? A cosmetic or nutritional product?
- Do you suffer from a disease that is not currently cured by conventional treatments, and are looking for a research facility that could accommodate you?
- Are you looking for a LRIPH that carries out research on adults and/or children?
- Does this LRIPH have a valid authorization issued by the ARS Île-de-France? And for what types of clinical trials?

Regularly updated, the interactive mapping tool below enables you to locate authorized LRIPHs in the Paris region by selecting different criteria :

- medical discipline,
- age of volunteers eligible to participate in protocols
- sites authorized to carry out first-in-man trials
- or authorized to carry out trials on healthy volunteers.

You can zoom in on the map, use the search engine or select the items of interest and click on one of the LRIPHs. You will then see :

- the authorization decree and the various criteria for which the site has been authorized by the Director General of ARS Île-de-France ;
- a presentation of the site (in French and English): research themes and useful contacts
